

Where the Money Is Going - Capital Flow Field Guide

MATRIX REPROGRAMMED | MAKING MONEY

CAPITAL FLOWS

AI compute and data centres [Established trend]

Private AI investment and hyperscale capital expenditure are expanding quickly.

Risk: Valuation, power constraints, rapid obsolescence and market concentration.

Electricity grids, storage and transformers [Structural bottleneck]

Power demand and new generation are outgrowing grid capacity in many regions.

Risk: Regulation, permitting, debt costs and project delays.

Energy security, nuclear and domestic supply [Established trend]

Security concerns are redirecting capital toward resilient domestic energy systems.

Risk: Policy reversals, cost overruns, commodity cycles and geopolitics.

Cybersecurity and identity protection [Structural demand]

More digital systems, AI use and critical infrastructure create a larger attack surface.

Risk: Crowded valuations, product obsolescence and customer concentration.

Robotics and industrial automation [Early-to-established]

Labour constraints and AI capability are accelerating investment in physical automation.

Risk: Long sales cycles, capital intensity and unreliable forecasts.

Water, climate adaptation and resilient infrastructure [Long-duration theme]

Aging systems, extreme weather and population growth create non-discretionary investment needs.

Risk: Political pricing, slow procurement and project execution.

Healthcare, ageing and biotechnology [Structural demand]

Ageing populations and scientific tools support long-term demand.

Risk: Regulation, reimbursement, patent expiry and trial failure.

Defence, logistics and supply-chain resilience [Policy-driven]

Security spending and supply-chain redesign are increasing procurement and domestic capacity.

Risk: Political change, ethical constraints, procurement cycles and valuation.
